2026

Relevance of the study

In the modern educational process, the effectiveness of learning directly depends on the choice of study methods

However, students do not always use the most effective strategies, which makes this research relevant

Goal and Objectives

Goal:

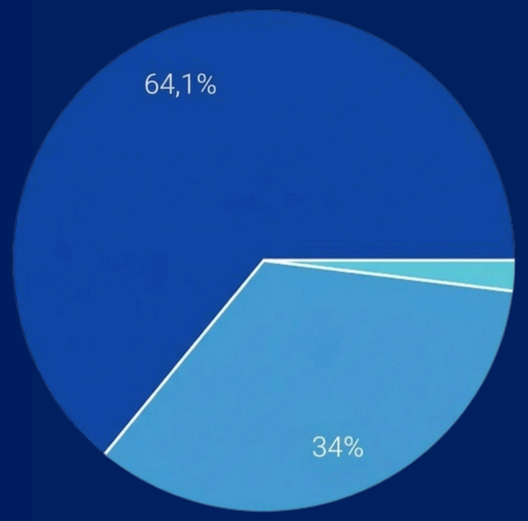
To study students’ preparation methods and determine their effectiveness

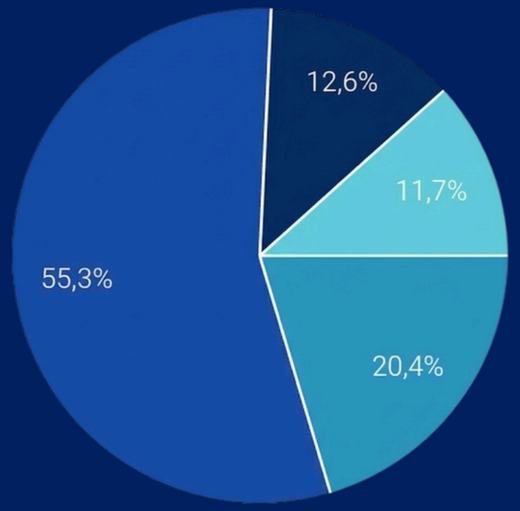
Objectives:

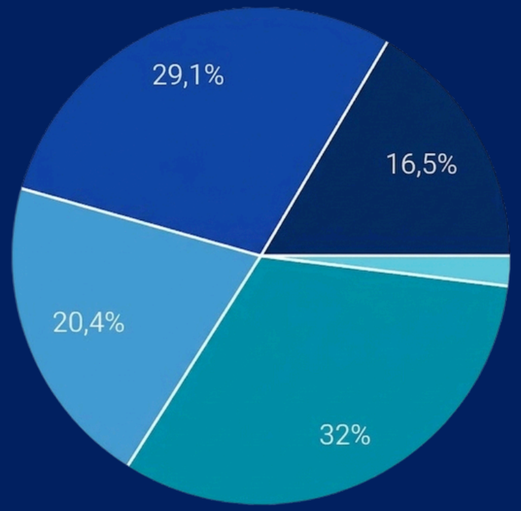
- Identify the study methods used
- Analyze preparation time
- Evaluate academic performance
- Determine the most effective methods

Research Methods

The study used a survey method. 103 respondents took part in the survey.

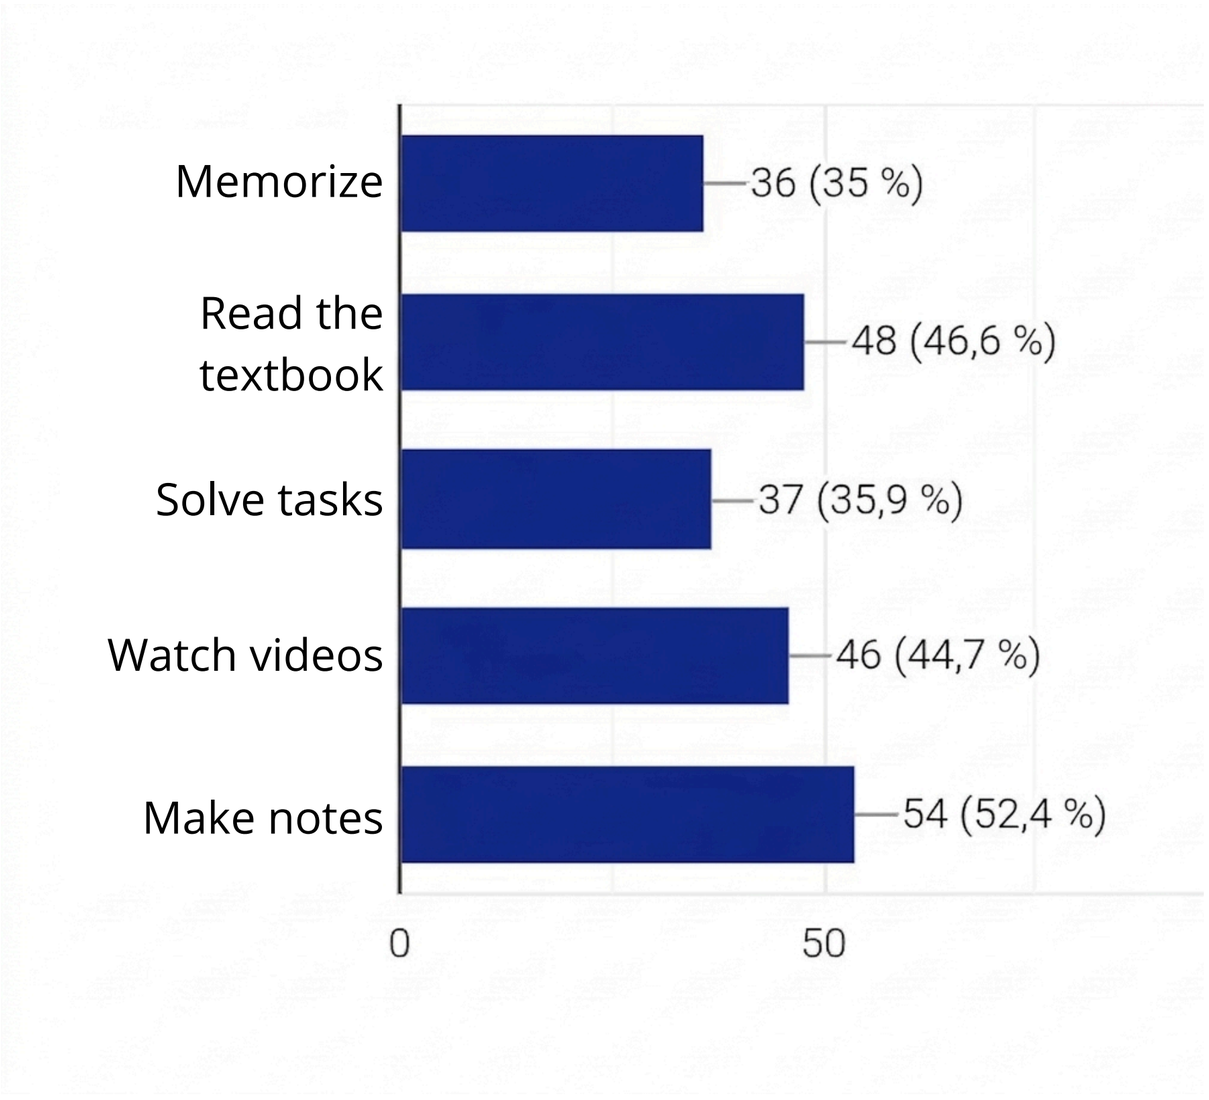


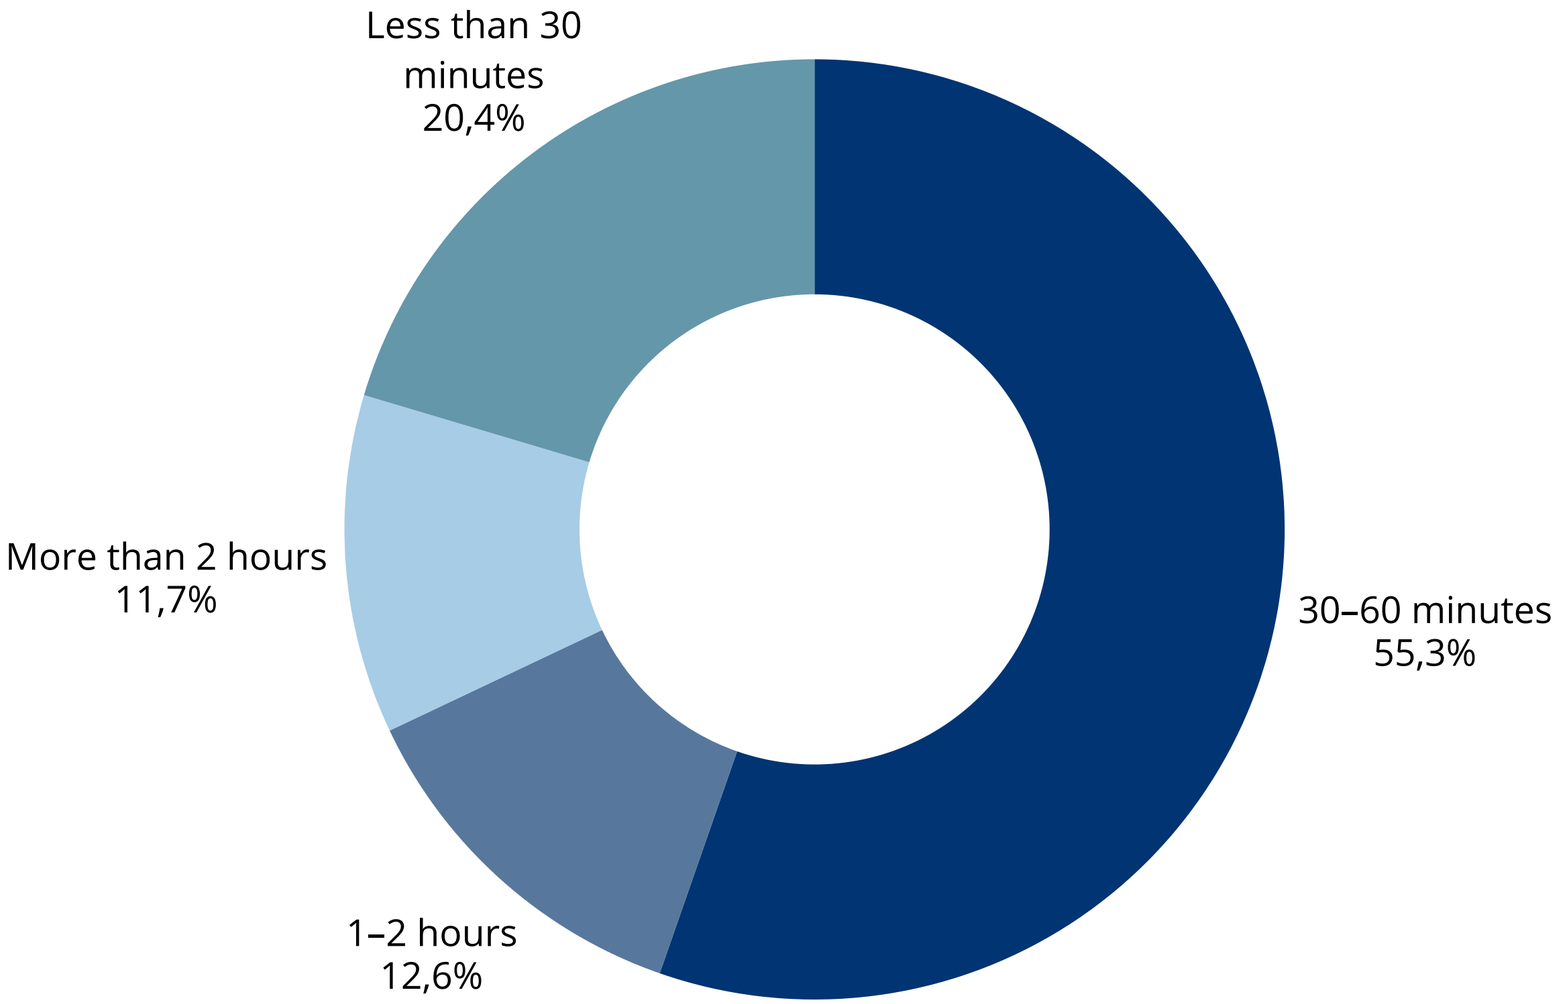




Study Methods

The most common method is **note-taking** (52.4%). Respondents were allowed to select multiple answer options



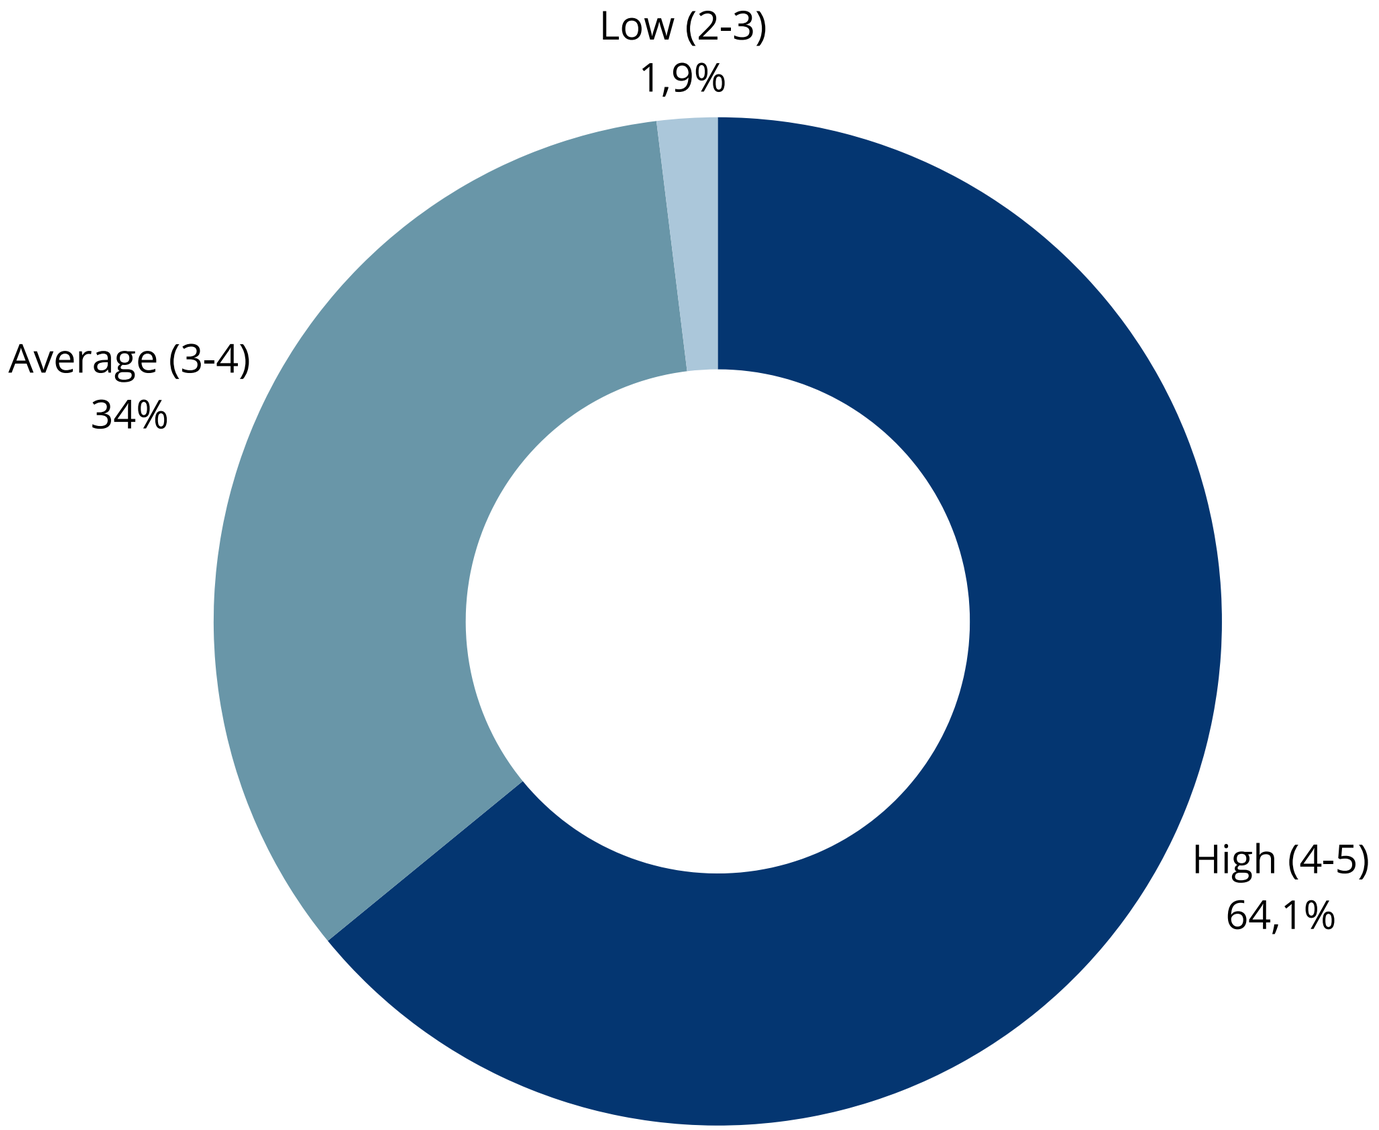


Preparation Time

Most students spend **30 to 60** minutes on preparation (55.3%).

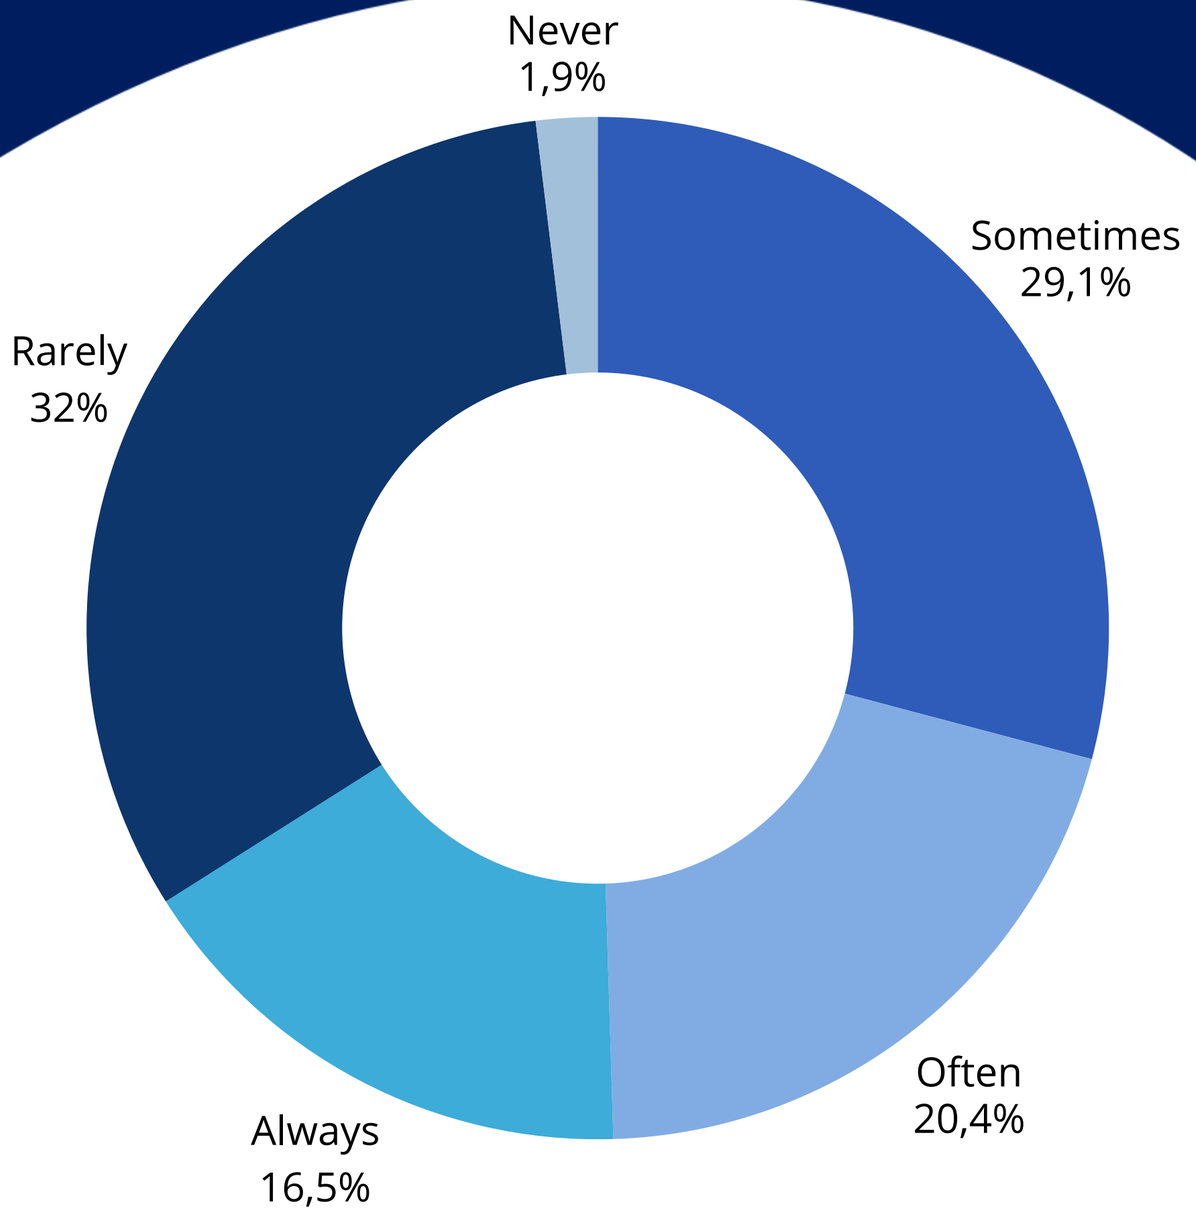
Academic Performance

Most respondents rate their academic performance as **high** (64.1%).

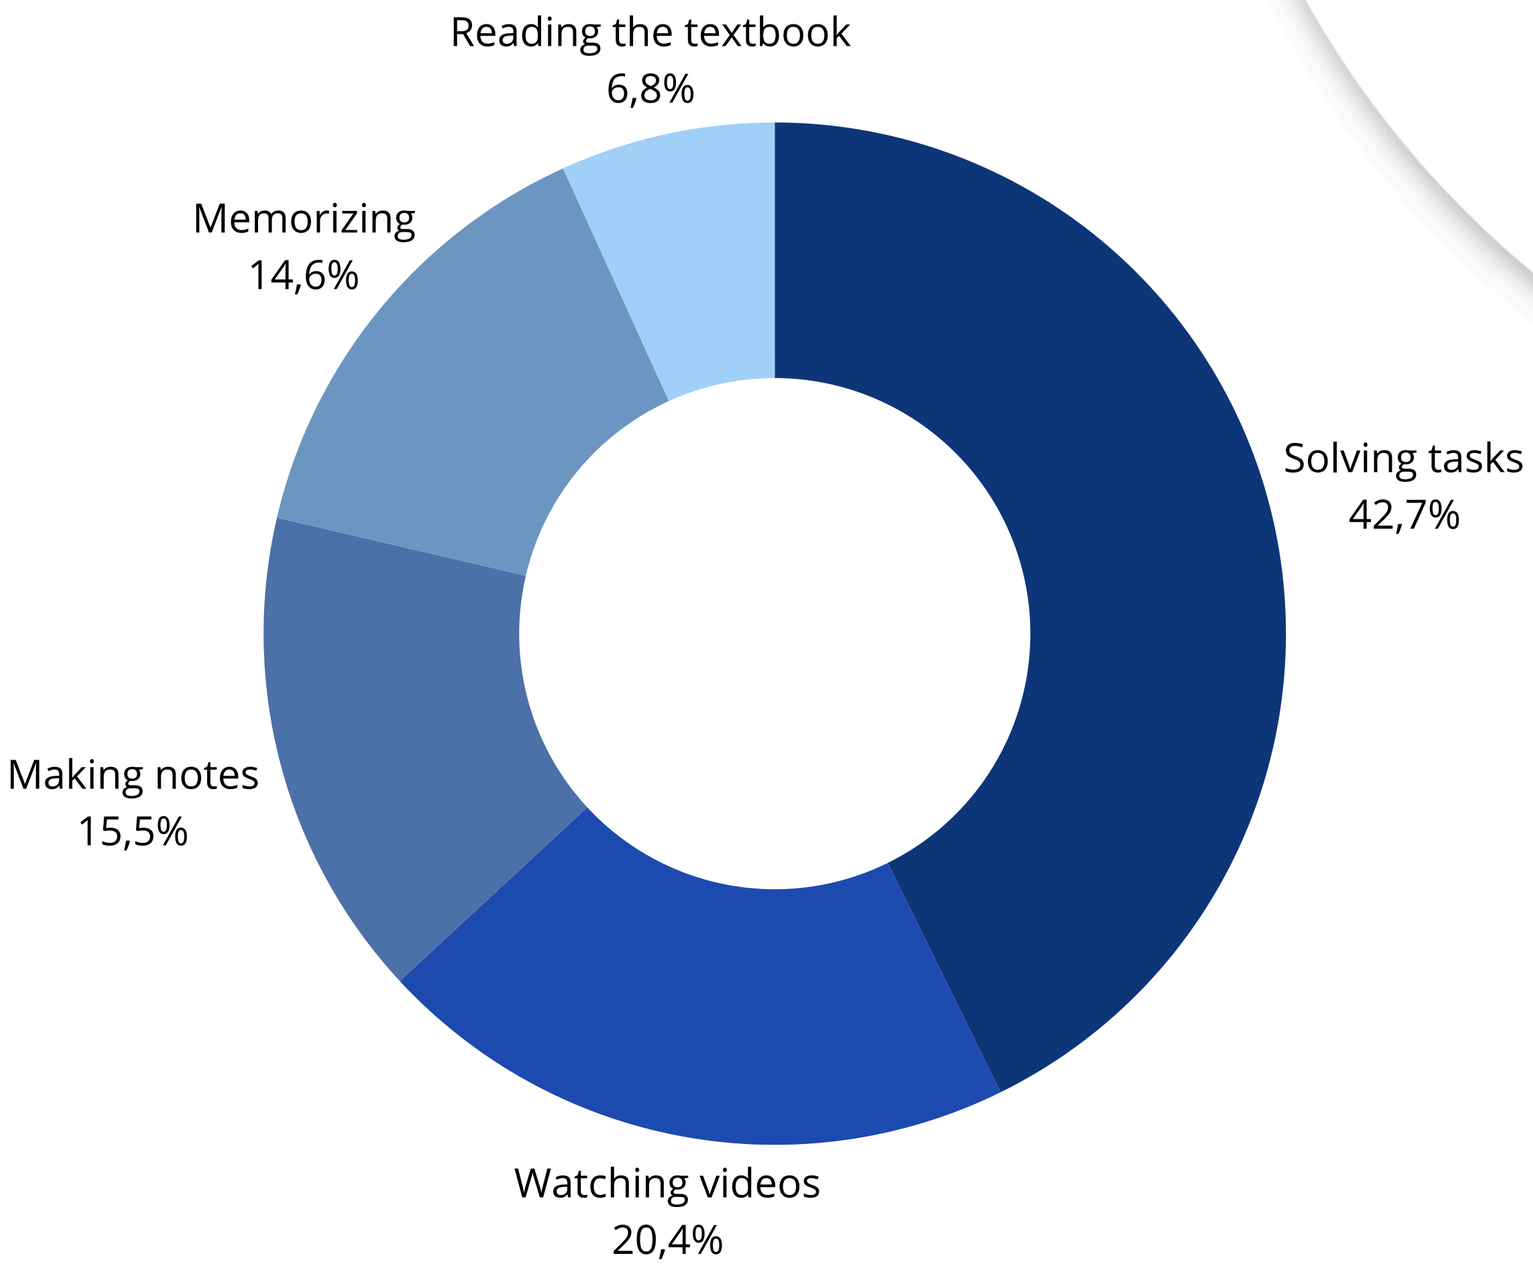


Reviewing the Material

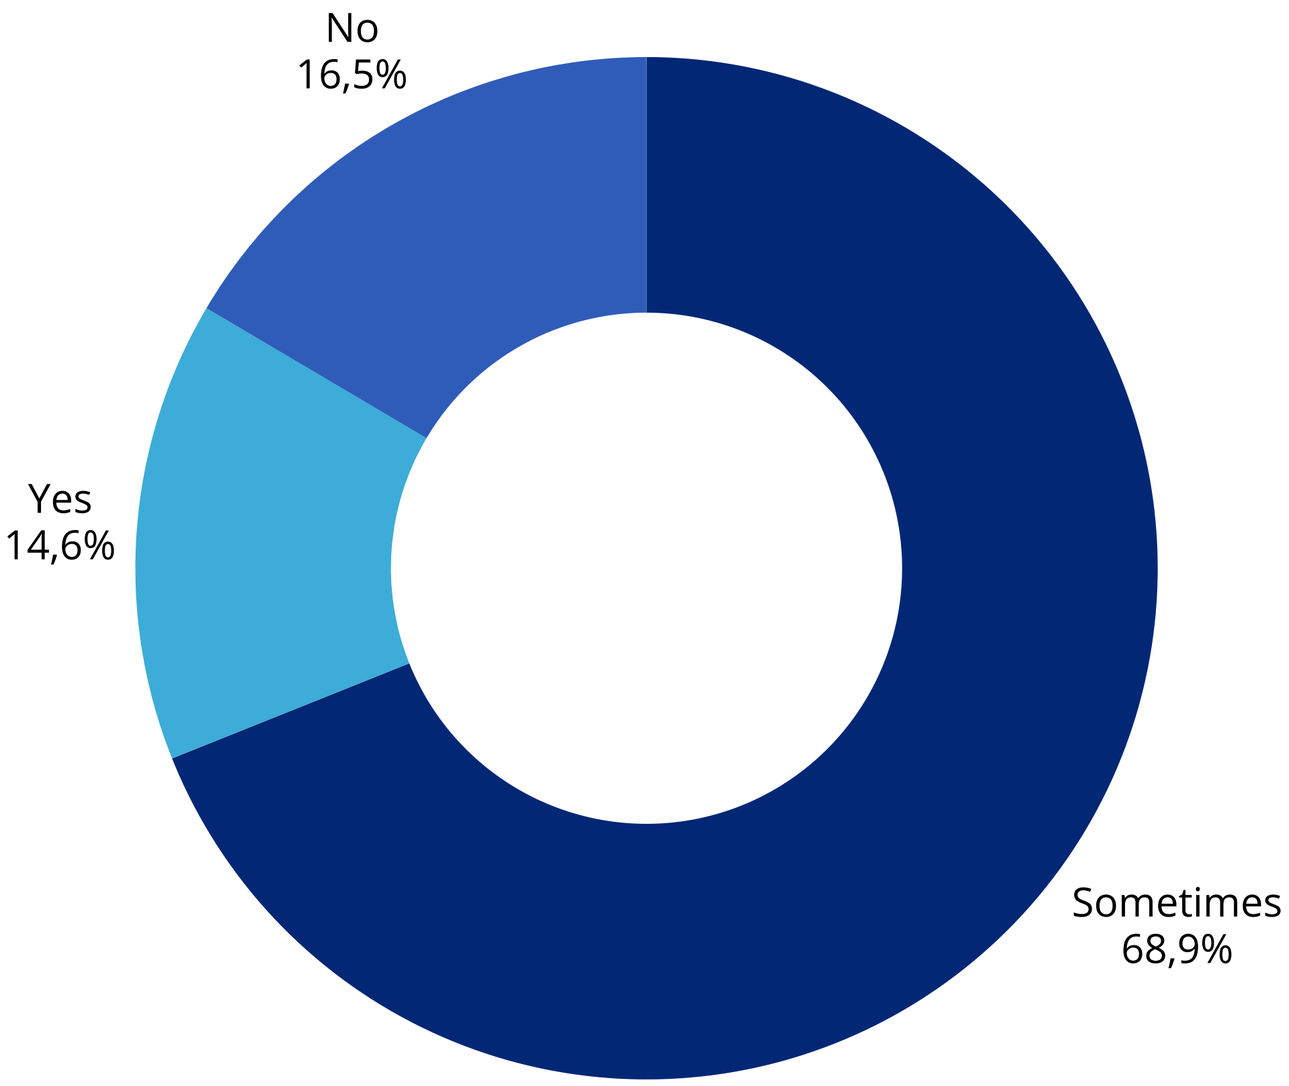
Regular review of the material is used to a limited extent, which may reduce long-term knowledge retention.



Effective Methods



Students consider **solving tasks** to be the most effective method (42.7%).



Learning Difficulty

Most students experience **difficulties in learning** (68.9%), which may be related to the insufficient effectiveness of the methods used.

KEY ANALYSIS

The study **revealed a contradiction**:

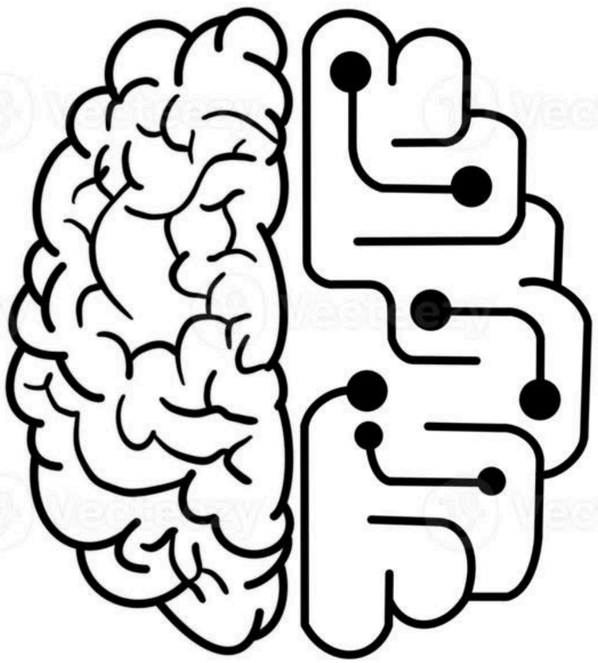
students more often use **passive learning methods** (note-taking)

however, they consider **active methods** (solving tasks) to be more effective

This indicates a mismatch between actual study practices and the understanding of effective learning

CONCLUSION:

The results of the study show that learning **effectiveness** directly depends on the **choice of method**. Active methods, such as solving tasks, have a more significant impact on academic performance, *however* are **used less frequently**.



Recommendations:

- It is recommended to use more *active* learning methods;
- To develop skills of reviewing and systematizing knowledge to improve learning effectiveness.
